DATA VISUALIZATION AND STORYTELLING

Sales Performance — FY2025

Prepared by: Raspreet Kaur
Dataset: Sample Superstore-style sales data
Tool used: Microsoft Excel and PowerPoint

About this project

For this project, I used the sales spreadsheet to look at monthly sales, compare regions and products, and check how sales changed from one month to the next. The aim was to find a few useful points that a business could follow up on.

$691,307	$47,661	6.9%	3,062
Total sales	Total profit	Profit margin	Units sold

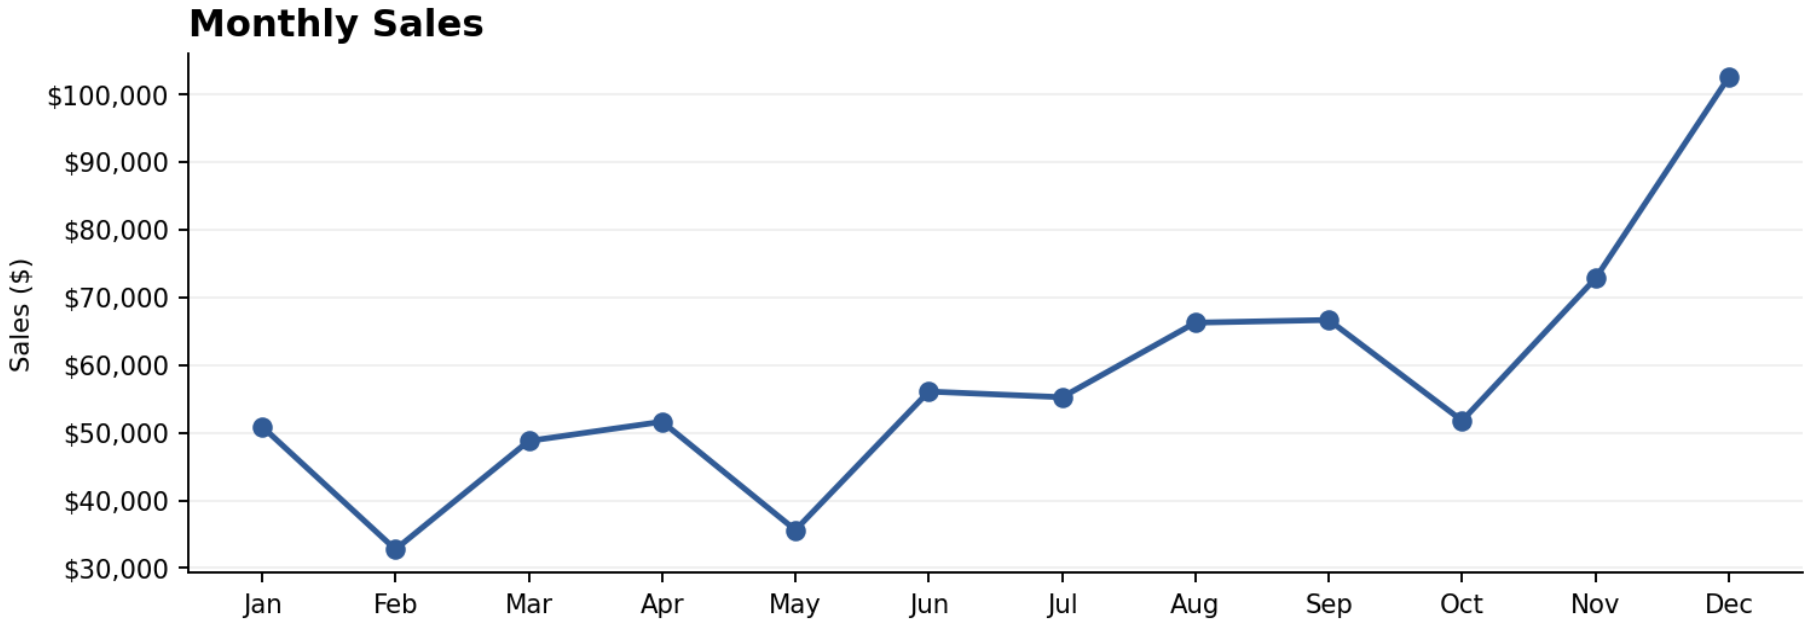

Question I wanted to answer

Which months, regions and products brought in the most sales, and what should be checked to improve profit?

The figures in this report come from the provided sample spreadsheet. They are used for practice and do not represent a real company's accounts.

1. Monthly Sales

This line chart shows how sales changed during the year. There are a few ups and downs, so it is useful to look at the months rather than only the yearly total.

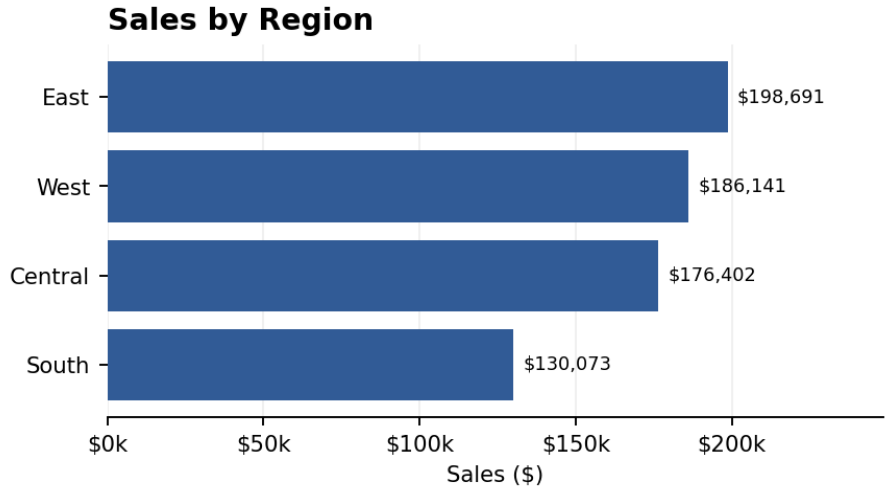

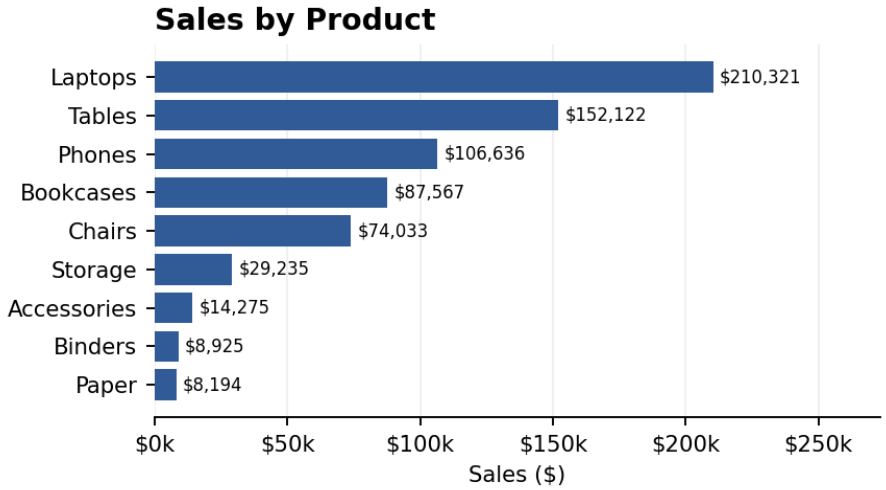

Takeaway: Sales were highest in Dec ($102,593) and lowest in Feb ($32,758).

What this may mean: The rise near the end of the year could be related to seasonal demand or larger orders. The order details would need to be checked before saying why it happened.

2. Sales by Region and Product

The charts below compare the sales total for each region and product. The longer bars show the higher sales values.

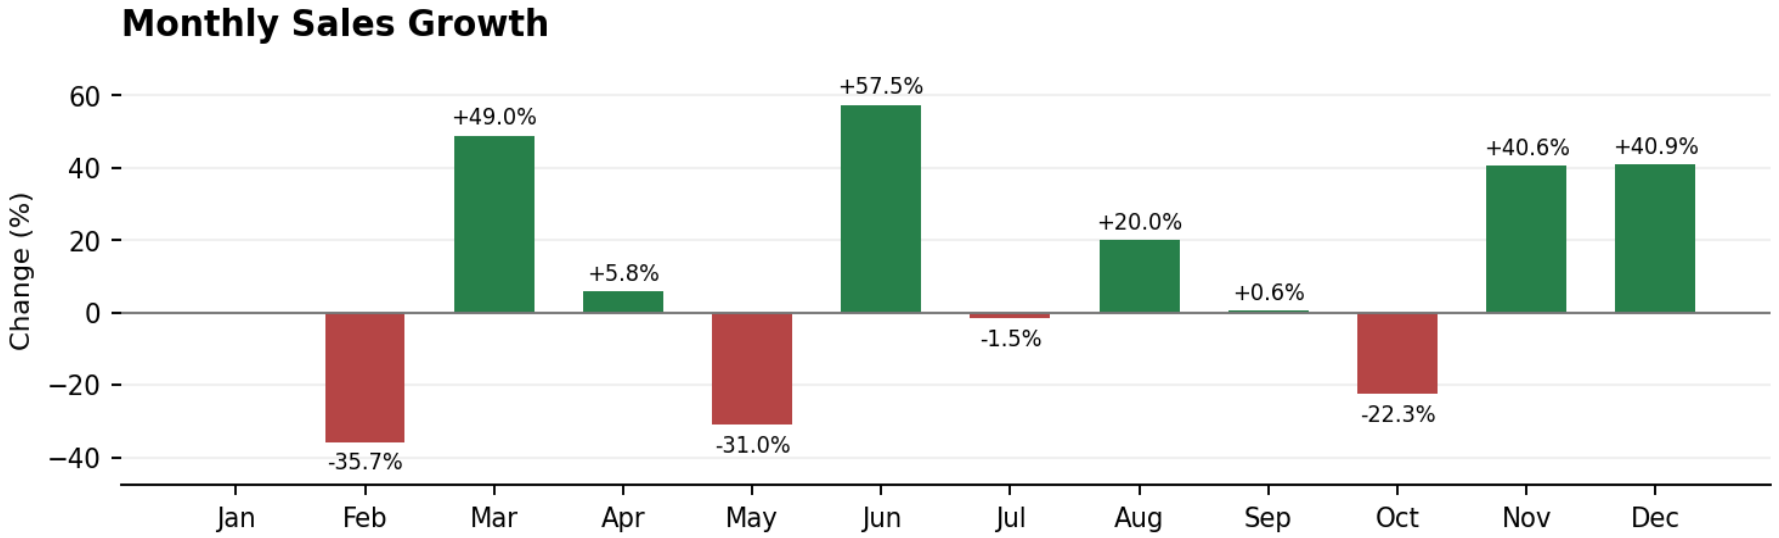

Takeaway: East had the highest regional sales ($198,691), while South had the lowest ($130,073).

Takeaway: Laptops had the highest sales among the products ($210,321).

This comparison can help decide where to check customer demand and stock levels. Sales alone do not show which region or product makes the most profit.

3. Monthly Growth and Profit

The growth chart compares each month with the month before it. Green bars show an increase and red bars show a decrease.

Takeaway: The biggest increase was in Jun (57.5%), and the biggest fall was in Feb (-35.7%).

Total sales	Total profit	Profit margin
$691,307	**$47,661**	**6.9%**

Takeaway: The overall profit margin is 6.9%. It is worth checking product profit and discounts as well as sales before making decisions.

4. What I Recommend

Based on these charts, I would look into the following points next:

1. Check the South region. Compare its order count, products sold and discounts with the other regions to understand why its sales are lower.

2. Keep an eye on Laptops. It has the highest sales total, so stock availability should be checked. Its profit should also be reviewed.

3. Review Feb and Jun. Check the orders from these months to understand the largest fall and rise in sales.

4. Look beyond sales. A product can sell well without giving the best profit, so compare profit and discount figures before changing prices or promotions.

5. Update the charts regularly. Monthly sales, regional sales, product sales and profit margin together give a clearer picture than one number alone.

Conclusion

The spreadsheet shows that sales changed during the year and differed across regions and products. These charts make the main patterns easier to see. The next step is to check the order details and profit figures to understand the reasons behind those patterns.
